Supporting information for 'Round robin test of secondary raw materials: a systematic review of performance parameters'

0. Document information

This document relates to the following article:

Authors	Nathalie Korf, Paul Martin Mählitz, Vera Susanne Rotter
Affiliation	Technische Universität Berlin, Chair of Circular Economy and Recycling Technology, Straße des 17. Juni 135, 10623 Berlin, Germany
Title	Round robin test of secondary raw materials: a systematic review of performance parameters
Publication date	[insert when published]
Journal	Reviews in Analytical Chemistry
Volume	[insert when published]
Issue	[insert when published]
DOI	[insert when published]

It provides supporting, additional information on

1. round robin tests in general,
2. the methodology applied for the systematic literature review,
3. description and categorization of performance parameters for round robin tests,
4. detailed results of the systematic literature review, and
5. the bibliography with all references used in the systematic literature review.

Content

1. Introduction: round robin test

1.1. Definition and use

Round robin test (RRT), also interlaboratory comparison (ILC) or proficiency testing (PT), is a testing approach with a certain, pre-defined purpose, focusing on one or more samples and one or more measurement or testing methods, with the involvement of multiple labs and one organizing and coordinating institution. The purposes for which RRT are conducted can generally be categorized into purposes addressing a) lab performance and b) method performance. The coordinating institution organizes an RRT by i) inviting to an RRT, stating the purpose of the RRT and the benefit for participating labs, ii) sending out samples and rules/regulations for participation, including data requirements and deadline, iii) processing and assessing the submitted RRT data, and iv) informing the participating labs about the overall and the lab-specific result. (DIN EN ISO/IEC 17043, 2010; Prichard and Barwick, 2007)

1.2. Overview norms

This section describes international norms, effective in the EU, regulating good laboratory practice in general and RRT in particular.

DIN EN ISO/IEC 17025 ‘General requirements for the competence of testing and calibration laboratories’ (17025, 2018) sets requirements for labs in general. Compliance with this norm can be understood as equal to good laboratory practice.

DIN EN ISO/IEC 17000 ‘Conformity assessment - Vocabulary and general principles’ (17000, 2020) sets terms and definitions for all steps of an RRT.

DIN EN ISO/IEC 17011 ‘Conformity assessment - Requirements for accreditation bodies accrediting conformity assessment bodies’ (2018) defines the requirements for institutions, which accredit laboratories. Both norms are mainly important on a regulatory and organisational level.

The two most important norms for the design, planning, execution, and evaluation of RRT are DIN EN ISO/IEC 17043 and DIN EN ISO/IEC 13528.

DIN EN ISO/IEC 17043 ‘Conformity assessment - General requirements for proficiency testing’ (DIN EN ISO/IEC 17043, 2010) is the international norm describing the use and application of RRT. It gives an overview over the types of RRT and proficiency testing, the design, necessary terms, definitions, and statistical parameters as well as technical and management requirements to conduct a well-designed and sucessful RRT.

DIN EN ISO/IEC 13528 ‘Statistical methods for use in proficiency testing by interlaboratory comparison’ (DIN ISO 13528, 2020) complements DIN EN ISO/IEC 17043 with a detailed description of statistical methods for RRT, guidelines for the design of RRT, determination of the reference/assigned value, determination of criteria for performance evaluation as well as calculation and graphical methods of performance parameters.

The norms DIN ISO 5725-1 to 5725-6 define principles of trueness and precision of measurement methods and hence set the standard how to assess the accuracy of an analysis. (5725-3, 2003; 5725-4, 2003; 5725-2, 2002; 5725-5, 2002; 5725-6, 2002; 5725-1, 1997)

2. Methodology systematic literature review

Figure 1 shows the flow chart for the systematic literature review applied in (Korf et al., 2022), based on (Liberati et al., 2009). It shows the four steps of the review, 1) identification of publications, 2) screening of the publications for eligibility, 3) extraction of pre-defined relevant information from the publications, and 4) assessment of the extracted information.

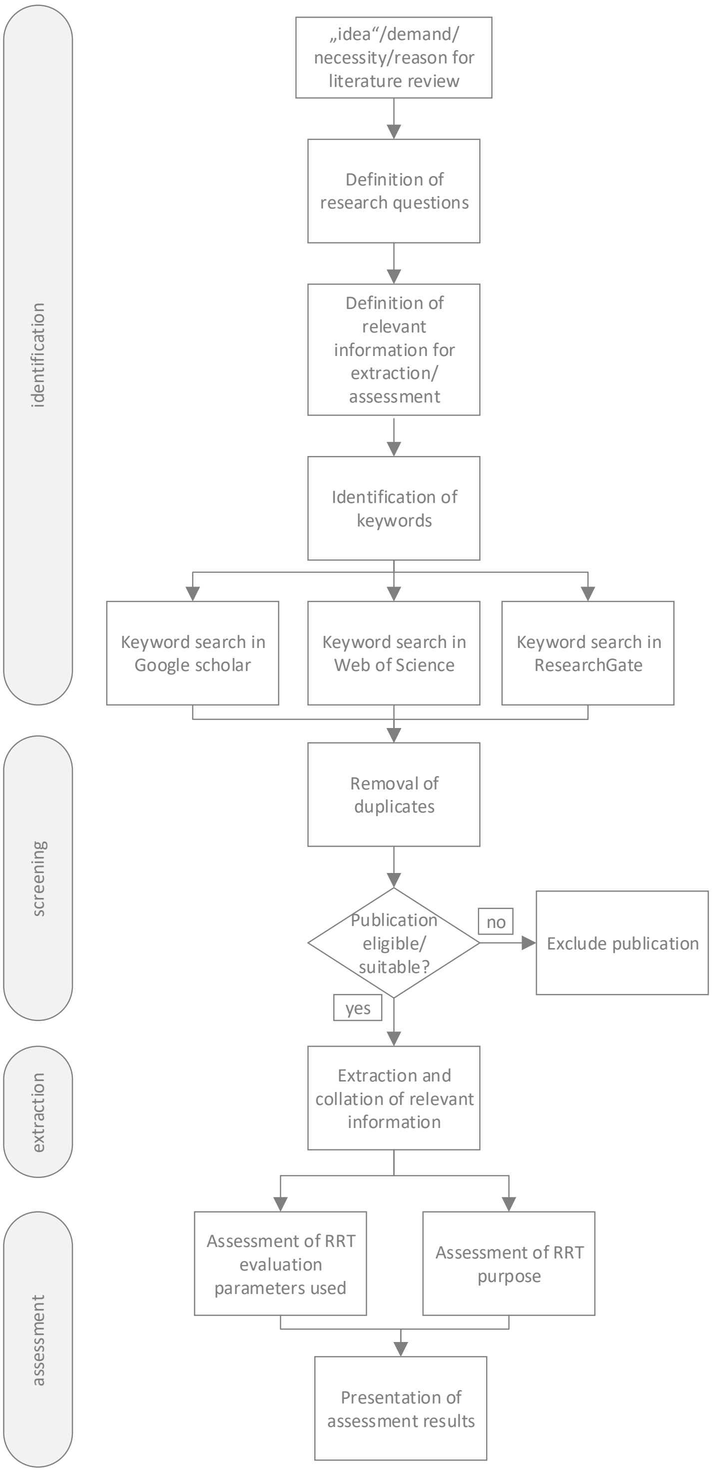

Figure 1: Flow chart methodology for systematic literature review, based on the PRISMA guidelines (Liberati et al., 2009)

3. Description performance parameters

3.1. Levels and cells: categorization of lab data

In the context of an RRT there is a multitude of data on different levels. For a better overview and a correct addressing of the data, we use the terms 'level' and 'cell' (Mandel, 1991). 'Level' describes the results for one element in one sample over all labs, e.g. results of four labs (mean or single values) for copper (Cu) in printed circuit boards (PCB). 'Cell' describes the results for the data of one lab in a level, e.g. results of lab 3 for Cu in PCB. Figure 2 shows the hierarchical relation between level and cell. The total number of elements is given with n, the related index is the chemical symbol (e.g. Cu). The total number of labs is indicated with p, the related index is j. For replicates, the number of the replicate is used as index (1, 2, 3…); the total number of replicates is m. Hence, the mass fraction of the second replicate for Cu in PCB of lab 3 is $x_{Cu,3,2}$. For mean values or standard deviations, no replicate index is necessary. This nomenclature is used for all equations throughout this document.

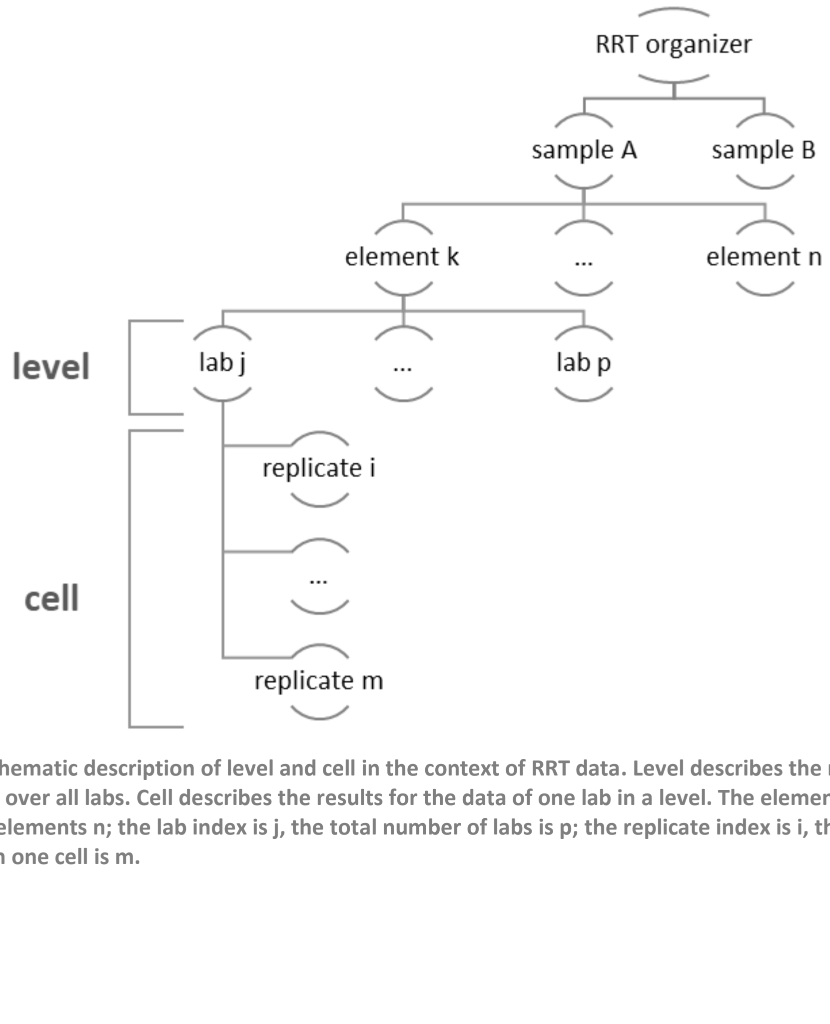

Figure 2: Schematic description of level and cell in the context of RRT data. Level describes the results for one element in one sample over all labs. Cell describes the results for the data of one lab in a level. The element index is k, the total number of elements n; the lab index is j, the total number of labs is p; the replicate index is i, the total number of replicates in one cell is m.

3.2. Accuracy: trueness and precision

DIN ISO 5725 describes accuracy of an analysis result using two parameters, 'trueness' and 'precision'. The trueness of a measurement/analysis result refers to the extent of the deviation from the 'true value' or accepted reference value (i.e. "the closeness of agreement between the arithmetic mean of a large number of test results and the true or accepted reference value"). The precision describes the variation within one data set (i.e. "the closeness of agreement between the arithmetic mean of a large number of test results and the true or accepted reference value"). (5725-1, 1997)

The trueness is affected by e.g. selection of an unsuitable analysis method or inaccurate execution of an analysis. Analytical effects leading to a bias, i.e. deviation from the 'true value', can be categorized in systematic effects and random effects (JCGM 100:2008, 2008).

The precision is affected e.g. by the reliability of an analysis method and/or the homogeneity/ heterogeneity of the sample material (JCGM 100:2008, 2008).

3.3. Performance parameters for quality control of lab data

In general, performance parameters to determine the accuracy of chemical analysis results can be categorised with regard to two perspectives, i) the scope of the quality control measures (internal or external) and ii) the type of performance parameter (trueness or precision).

All trueness performance parameters (TPP) identified in (Korf et al., 2022) describe the (absolute or relative) deviation of the lab result to a pre-defined value (e.g. reference, assigned, or consensus value). This deviation is accompanied by different denominators, such as a mean value or a standard deviation. Precision performance parameters (PPP) describe the variability of a data set, which is oftentimes expressed as a (version of the) standard deviation.

Table 2 in (Korf et al., 2022) gives an overview over the most common performance parameters within these categories.

The following boxes 1 to 4 give an overview over general descriptive statistics (box 1) and all PP identified in (Korf et al., 2022), categorized in TPP (PP assessing the deviation of a value in box 2; significance tests in box 3) and PPP (parameters of variation and uncertainty in box 4).

Box 1: Descriptive statistics

Equations

All descriptive statistics are extracted from [Wilcox, 2009 and Wilcox, 2010].

Location parameters:

- arithmetic mean

  $\bar{x} = \frac{1}{n}\sum_{i=1}^{n} x_i$ (1)

- median

  if data set has odd number n of values:

  $\tilde{x} = x_{(n+1)/2}$ (2)

  if data set has even number n of values:

  $\tilde{x} = \frac{x_{n/2}+x_{(n+1)/2}}{2}$ (3)

Parameters of variation:

- range

  $range = max - min$ (4)

- relative range

  $rel.range = \frac{range}{\bar{x}} \cdot 100\%$ (5)

- standard deviation

  $s_i = \sqrt{\frac{1}{n-1}\sum_{i=1}^{n}(x_i - \bar{x})^2}$ (6)

- relative standard deviation

  $RSD = \frac{s_i}{\bar{x}}$ (7)

- MAD

  $MAD = median(x_i - \tilde{x})$ (8)

Parameter descriptions

Parameter	Description
n	number of values in a data set
x_i	single value in a data set
max	largest value in a data set
min	smallest value in a data set

Box 2: Parameters assessing the deviation of a value

Equations

- absolute deviation
  (DIN ISO 13528, 2020)

$$D = (\bar{x}_{j,k} - X_k) \quad (9)$$

- relative deviation
  (DIN ISO 13528, 2020)

$$RD = \left(\frac{\bar{x}_{j,k} - X_k}{X_k}\right) \cdot 100\% \quad (10)$$

- standardized bias
  (Johnston and Daniel, 1982)

$$e_{j,k} = \frac{\bar{x}_{j,k} - X_k}{s_{i,j}\sqrt{\frac{1}{m}\frac{p-1}{p}}} \quad (11)$$

- z score
  (DIN ISO 13528, 2020)

$$z = \frac{\bar{x}_{j,k} - X_k}{s_{RRT}} \quad (12)$$

- robust z score
  (Da Silva Dias et al., 2015)

$$z_{robust} = \frac{\sum_{i=1}^{m} x_i - median(\sum_{i=1}^{m} x_i)}{IQN(\sum_{i=1}^{m} x_i)} \quad (13)$$

- z' score
  (DIN ISO 13528, 2020)

$$z' = \frac{\bar{x}_{j,k} - X_k}{\sqrt{s_{RRT}^2 + u^2(\bar{x}_{j,k})}} \quad (14)$$

- z_U score
  (DIN 38402-45, 2014)

$$z_U = \begin{cases} \frac{g}{k_1} \cdot z\,, for\ z < 0 \\ \frac{g}{k_2} \cdot z\,, for\ z \geq 0 \end{cases} \quad (15)$$

- zeta score
  (DIN ISO 13528, 2020)

$$\zeta = \frac{\bar{x}_{j,k} - X_k}{\sqrt{u_{test}^2 + u_{RRT}^2}} \quad (16)$$

- E_n score
  (DIN ISO 13528, 2020)

$$E_n = \frac{\bar{x}_{j,k} - X_k}{\sqrt{U_{test}^2 + U_{RRT}^2}} \quad (17)$$

- Mandel's h
  (Mandel, 1991)

$$h_{i,j} = \frac{\bar{x}_{j,k} - C_k}{(s_L)_k} \quad (18)$$

Parameter descriptions

Parameter	Description
m	number of replicates in a cell
m_j	number of replicates for lab j
m_{ref}	number of replicates for reference lab
$\bar{x}_{j,k}$	mean value of all replicates for element k in lab j, $\bar{x}_{j,k} = \frac{1}{m_j}\sum_{i=1}^{m} x_{i,j,k}$ (19)
X_k	assigned/reference value; if produced from reference lab analyses: $X_k = \bar{x}_{ref} = \frac{1}{m_{ref}}\sum_{i=1}^{m} x_{i,j,k}$ (20)
p	number of laboratories
$s_{i,j}$	pooled standard deviation of the within-laboratory replicates adjusted for the number of replicates m and the number of labs p
s_{RRT}	standard deviation used in RRT; is selected depending on required informative value, e.g. SD of assigned value, between-lab SD, or as in equation (37)
IQN	normalized interquartile range, $IQN = 0.7313 \cdot IQR$ (21)
IQR	interquartile range, difference between 3. quartile and 1. quartile
u_{test}	participant's own estimate of the standard uncertainty of its result $x_{j,k}$, see par. descr. in box 4
u_{RRT}	standard uncertainty of the assigned value X_k, see par. descr. in box 4
U_{test}	expanded uncertainty of a participant's result $x_{j,k}$, see equation (39)
U_{RRT}	expanded uncertainty of the assigned value X_k, see equation (39)
k_1 k_2	$\left(k_2 + \frac{1}{v}\right) \cdot e^{\left\{-\frac{1}{2}k_2^2\right\}} = \left(-k_1 + \frac{1}{v}\right) \cdot e^{\left\{-\frac{1}{2}k_1^2\right\}}$ (22); $\left(1 - \Phi\left(-\frac{1}{v}\right)\right)^{-1} \left(\Phi(k_2) - \Phi(-k_1)\right) = 1 - \alpha$ (23)
C_k	average for one element in one level, i.e. over all laps $C_k = \frac{1}{p}\sum_{i=1}^{p} \bar{x}_{j,k}$ (24)
$s_{L,k}$	standard deviation between cell mean and level mean for one element, $s_{L,k} = \sqrt{\frac{\sum_{i=1}^{p}(\bar{x}_{j,k} - C_k)^2}{p-1}}$ (25)

Box 3: Significance tests

Equations

***t* test (Rand R. Wilcox, 2009):**

- test hypothesis: $\bar{x}_{j,k}$ is equal to X_k
- *t* statistic:
  - for equal number of replicates m and homoscedasticity:

$$t = \frac{\bar{x}_{j,k} - X_k}{s_p \sqrt{\left(\frac{1}{m_i} + \frac{1}{m_{ref}}\right)} \qquad (26)$$

  - for unequal number of replicates m and heteroscedasticity:

$$W = \frac{\bar{x}_{j,k} - X_k}{\sqrt{\frac{s_{j,k}^2}{m_i} + \frac{s_{ref}^2}{m_{ref}}}} \qquad (27)$$

- t_{crit}, W is defined by m_j and α
- test hypothesis is rejected for t, W > t_{crit}

u test (Shakhashiro and Toervenyi, 2010):

- test hypothesis: $\bar{x}_{j,k}$ is equal to X_k
- U statistic:

$$U = \frac{|\bar{x}_{j,k} - X_k|}{\sqrt{u_{test}^2 + u_{test}^2}} \qquad (28)$$

- $\bar{x}_{j,k}$ is not significantly different, if U < 2.58

ANOVA (Rand R. Wilcox, 2009):

- test hypothesis: more than two means are equal to each other ($\bar{x}_1 = \bar{x}_2 = \cdots = \bar{x}_n$)
- $MS = \frac{\sum_{i=1}^{n}(x_i - \bar{x})^2}{df} = s^2$
- test statistic:

$$F = \frac{MS_{between-group}}{MS_{within-group}} \qquad (29)$$

- means differ significantly for $F > F_{crit}$

Tukey's Honestly Significant Difference test (Tukey, 1977):

- test hypothesis: two or more than two means are equal to each other ($\bar{x}_1 = \bar{x}_2 = \cdots = \bar{x}_n$)
- test statistic:

$$HSD = q\sqrt{\frac{MS}{m}} \qquad (30)$$

- honestly significant difference is shown, when the pairwise difference between two means is larger than HSD.

Parameter descriptions

Parameter	Description
s_p	mean standard deviation, $s_p = \sqrt{\frac{s_{j,k}^2 + s_{ref}^2}{2}}$ (31)
$s_{j,k}^2$	variance of lab data in one cell and one level, i.e. for one lab and one element, $s_{j,k}^2 = \frac{1}{m_j - 1}\sum_{i=1}^{m}\left(x_{i,j,k} - \bar{x}_{j,k}\right)^2$ (32)
$s_{j,k}$	Standard deviation of lab data in one cell and one level, i.e. for one lab and one element, $s_{j,k} = \sqrt{s_{j,k}^2} = \sqrt{\frac{1}{m_j - 1}\sum_{i=1}^{m}\left(x_{i,j,k} - \bar{x}_{j,k}\right)^2}$ (33)
s_{ref}^2	variance of reference lab data for one element, $s_{ref}^2 = \frac{1}{m_{ref} - 1}\sum_{i=1}^{m}\left(x_{i,ref} - \bar{x}_{ref}\right)^2$ (34)
m_j	number of replicates for lab j
m_{ref}	number of replicates for reference lab
α	probability of type I error, i.e. probability of a false positive
MS	mean square
F_{crit}	value of F distribution, for defined degrees of freedom from samples
df	degrees of freedom
q	value from studentized range distribution table for m and α

Box 4: Parameters of variation and uncertainty

Equations

- Range: see box 1, equation (4)
- Relative range: see box 1, equation (5)
- Standard deviation: see box 1, equation (6)
- Relative standard deviation: see box 1, equation (7)
- MAD: see box 1, equation (8)
- Between-lab standard deviation for element k (Mandel, 1991)

$$s_{L,k} = \sqrt{\frac{\sum_{i=1}^{p}\left(\bar{x}_{j,k} - C_k\right)^2}{p-1}} \quad (35)$$

- Repeatability standard deviation for element k (Mandel, 1991)

$$s_r = \sqrt{\frac{\sum_{j=1}^{p} s_{j,k}^2}{p}} \quad (36)$$

- Reproducibility standard deviation for element k (Horwitz and Albert, 2006)

$$s_R = \sqrt{s_L^2 + s_r^2} \quad (37)$$

- Standard deviation for round robin test (DIN ISO 13528, 2020)

$$s_{RRT} = \sqrt{s_R^2 - s_r^2\left(1 - \frac{1}{m}\right)} \quad (38)$$

- Mandel's k for element k in lab j (Mandel, 1991)

$$k_{j,k} = \frac{s_{j,k}}{s_r} \quad (39)$$

- (combined, expanded) uncertainty (GUM)

$$u_c^2(x_k) = \sum_{i=1}^{N}\left(\frac{\delta f}{\delta x_{i,j,k}}\right)^2 u^2\left(x_{i,j,k}\right) \quad (40)$$

Parameter descriptions

Parameter	Description
$u^2\left(x_{i,j,k}\right)$	standard uncertainty, determined by method A or method B, specified in (JCGM 100:2008, 2008)

4. Detailed results literature review

The following tables present the detailed results of the systematic literature review in (Korf et al., 2022). Tables 1 to 4 show the identified TPP and PPP in peer-reviewed articles as well as reports, conference proceedings, and papers. Tables 5 and 6 summarize the identified purposes, sample materials, and analysis types.

4.1. Performance parameters assessing the trueness TPP)
